ABSTRACT OF THE DISCLOSURE Solid Catadioptric Lens with a Single Viewpoint

A solid catadioptric lens with a single viewpoint has a spherical refractive surface with a center C on an optical axis of the lens. An ellipsoidal reflective surface of the lens faces the spherical refractive surface such that a first focus F₁ of the ellipsoidal reflective surface is coincident with the center C of the spherical refractive surface. Furthermore, the lens has a shaping surface facing the ellipsoidal reflective surface for shaping a light that passes the single viewpoint. The shaping surface can be refractive, reflective or semi-transparent and its shape can be ellipsoidal with its first focus F_1 ' coincident with the second focus F2 of the ellipsoidal reflective surface. single viewpoint of the lens is at the center C of the spherical reflective surface and is enforced with an aperture that can be positioned at various points inside, on a surface or even outside the lens, depending on the type of shaping surface chosen.
